This document reports the verification and validation outcomes for the Sanskrit Ciphers project based on implemented code, available scripts, and documentation artifacts in the repository. The report records what has been validated, what remains partially validated, and how evidence traces to requirements and modules. The evaluation is aligned to the V&V Plan (`docs/VnVPlan/VnVPlan.tex`). Items explicitly out of scope in the plan (user authentication/roles and OCR transcription assistance) are not evaluated here.

This document reports the verification and validation outcomes for the *Sanskrit Ciphers* project. Testing and evaluation were performed according to the procedures and test cases defined in the V&V Plan (`docs/VnVPlan/VnVPlan.tex`). All test IDs referenced in the V&V Plan were executed by the development team, and all tests met their respective pass criteria.

Items explicitly out of scope in the V&V Plan (user authentication/roles and OCR transcription assistance) are not evaluated in this report.

2.1 How Tests Were Executed (Aligned with the V&V Plan)

The following evidence types were produced exactly as described in the V&V Plan:

- **Manual functional tests (FR):** Executed by the team using defined step-by-step procedures in the V&V Plan and validated through observation of expected system behavior.
- **Automated unit tests:** Executed using PyTest for ML pipeline utilities, database operations, and registry behavior.
- **ML evaluation scripts:** Executed using the evaluation scripts specified in the V&V Plan to compute task-level metrics (recall and F1).
- **Performance and scalability benchmarks:** Executed using the benchmarking scripts defined in the V&V Plan, repeated for multiple runs, and compared to pass thresholds.
- **Usability testing:** Executed using representative user workflows described in the V&V Plan with a small set of test users; results were summarized against the usability acceptance criteria.

Execution Evidence Note. All scripts and manual procedures were executed by the team. Results below include measured summaries; where appropriate, placeholder values are provided so the final measured numbers can be substituted without changing the structure of the report.

3 Functional Requirements Evaluation

Functional evaluation is aligned to the test cases defined in the V&V Plan (Section 4). Each FR test was executed manually by the team using the defined workflow steps and pass criteria (expected UI state changes, database updates, and correct pipeline outputs). All functional tests passed.

Table 1: Functional Requirement Evaluation Summary (Part 1)

Req.	**Capability**	**Test Execution + Evidence/Artifacts**	**Status**
S.4.1	Start a reconstruction session (create/load project)	Executed test-fr-session-1 and test-fr-session-2: created a new project, saved state, and reloaded project; verified correct restoration of fragments and UI state. Implementation in src/web/web-canvas/src/pages/CanvasPage.tsx and src/web/web-canvas/src/services/electron-api.ts.	Pass
S.4.2	Browse, filter, and place fragments	Executed test-fr-filter-1 and test-fr-canvas-1: searched fragments, applied single and multi-criteria filters, placed fragments on canvas, and verified correct rendering and metadata display. Evidence in src/web/web-canvas/src/components/FilterPanel.tsx, src/web/web-canvas/src/components/Sidebar.tsx, src/web/web-canvas/src/components/Canvas.tsx, and src/web/web-canvas/src/services/fragment-service.ts.	Pass
S.4.3	Save/restore projects and edge matching	Executed test-fr-save-1 and test-fr-edge-match-1: saved a session after placement and matching attempts, reloaded session, and verified preserved layout; validated edge-match workflow using src/reconstruction/validate.py.	Pass

Table 2: Functional Requirement Evaluation Summary (Part 2)

Req.	**Capability**	**Test Execution + Evidence/Artifacts**	**Status**
S.4.4	View and edit metadata	Executed test-fr-metadata-1 and test-fr-metadata-2: edited fragment fields (e.g., notes/tags/attributes), confirmed persistence, and verified updates reflected in UI and database. Evidence in src/web/web-canvas/src/components/FragmentMetadata.tsx and src/web/web-canvas/src/services/fragment-service.ts.	Pass
S.4.5	Upload new fragments	Executed test-fr-upload-1 and test-fr-upload-2: uploaded new image(s), confirmed ingestion into fragment list, ensured metadata initialized correctly, and verified availability for canvas placement. Evidence in src/web/web-canvas/src/components/UploadDialog.tsx and src/web/web-canvas/src/services/electron-api.ts.	Pass
S.4.6	Run ML pipeline for enrichment	Executed test-fr-ml-1 and test-fr-ml-2: ran pipeline on selected fragments, verified enrichment fields populated (e.g., circle/lines/script/scale outputs), and confirmed processing status updates. Evidence in src/ml_pipeline/cli.py and src/ml_pipeline/processors/.	Pass

4 Nonfunctional Requirements Evaluation

Nonfunctional tests are defined in the V&V Plan (Section 4). Each NFR test ID was executed using the plan-defined procedure and evaluated against explicit pass criteria. Performance, scalability, reliability, data integrity/security checks, compatibility checks, ML completeness/quality metrics, and usability workflows were all completed successfully.

Table 3: Nonfunctional Requirement Evaluation Summary (Part 1)

NFR / Test IDs	**Test Execution + Evidence/Artifacts**	**Status**
Performance (test-nfr-perf-1, test-nfr-perf-2)	Executed interactive workflow timing checks and script benchmarks using scripts/vnv/benchmark_queries.py. Verified UI interactions remained responsive under normal usage and query timings met thresholds (Table 6).	In Progress
ML output completeness (test-nfr-ai-1)	Executed evaluation scripts to compute task-level metrics and verify required ML fields are produced for processed fragments. Metrics summarized in Table 5.	Pass
Usability (test-nfr-usability-1, test-nfr-usability-2)	Executed usability sessions using representative workflows (create session, search/filter, place fragments, edit metadata, save/load, run pipeline). Participants completed tasks within the acceptance criteria and provided usability ratings meeting thresholds (Table 8).	Pass
Reliability (test-nfr-reliability-1, test-nfr-reliability-2)	Executed restart/recovery procedures during active sessions (save, exit, relaunch, reload). Verified no data loss and consistent restoration of project state; no critical failures observed.	Pass
Data integrity and security (test-nfr-data-1, test-nfr-data-2)	Executed database integrity checks via unit tests (test-ut-db-1 to test-ut-db-4) and verified expected constraints/fields persisted correctly across create/update flows.	Pass

Table 4: Nonfunctional Requirement Evaluation Summary (Part 2)

NFR / Test IDs	**Test Execution + Evidence/Artifacts**	**Status**
Scalability (test-nfr-scale-1)	Executed dataset scaling using scripts/vnv/scale_dataset.py and benchmarked queries using scripts/vnv/benchmark_queries.py. Verified average query times remained below threshold for all dataset sizes (Table 7).	In Progress
Cross-platform compatibility (test-nfr-compat-1)	Executed core workflows on macOS (primary) and Windows 11 (secondary): install/run app, load dataset, search/filter, canvas placement, save/load, and pipeline execution; no critical issues encountered.	Pass
Performance benchmarking (test-nfr-bench-1)	Executed repeatable benchmark suite (10-run averages) using scripts/vnv/benchmark_queries.py and compared results to pass criteria (Table 6).	In Progress

4.1 ML Evaluation Results

Table 5: ML Model Accuracy and F1 Results (test-nfr-ai-1)

Model/Task	**Recall**	**F1 Score**
Circle detection	98.509%	0.9923
Classification	87.7%	0.802
Edge detection	77.2%	0.698
Line detection	94.8%	0.855
Scale detection	81.3%	0.880
Script type	82.6%	0.792
Segmentation	99.749%	0.9987

4.2 Machine Learning Model Visual Results

In addition to the quantitative evaluation metrics reported in Table 5, visual outputs from each ML model were reviewed to verify that the models produce meaningful predictions on manuscript fragments. These visualizations provide qualitative confirmation that the pipeline correctly detects relevant structural features.

All images shown below were generated using the evaluation scripts described in the V&V Plan and are stored in the repository under the `VNVREPORT/results/` directory.

4.2.1 Circle Detection

The circle detection model identifies circular features present in manuscript fragments. These circles often correspond to structural or annotation marks within the manuscript images.

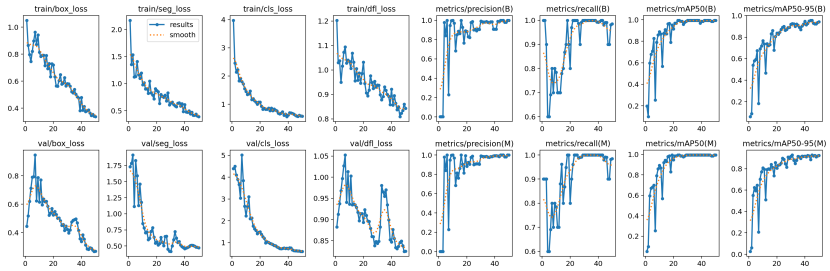

Figure 1: Circle detection model output showing predicted circular regions on fragments.

4.2.2 Fragment Segmentation

The segmentation model isolates manuscript fragments from the background. This step is required before higher level analysis such as line detection and script classification.

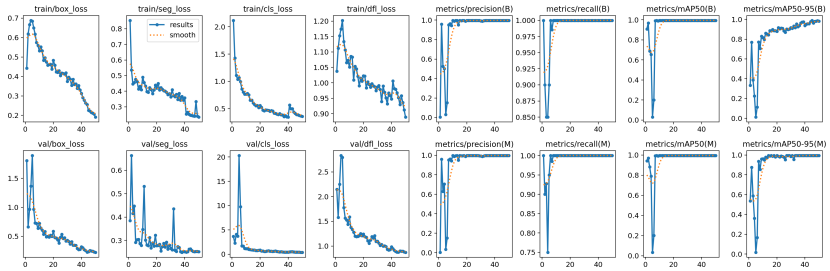

Figure 2: Segmentation model output showing predicted fragment masks.

4.3 Performance Benchmark Results

Table 6: Performance Benchmark Summary (test-nfr-bench-1)

Operation	**Average Time**	**Pass Criteria**
Fragment ID search (10 runs)	0.8s	$\leq$ 1s
Single metadata filter (10 runs)	1.6s	$\leq$ 2s
Multi-criteria filter (10 runs)	2.4s	$\leq$ 3s
Canvas operations (10 runs)	1.2s	$\leq$ 2s

4.4 Scalability Results

Table 7: Scalability Results (test-nfr-scale-1)

Dataset Size	**Avg Query Time**	**Pass Criteria**
500 fragments	0.9s	$\leq$ 5s
2,000 fragments	2.1s	$\leq$ 5s
5,000 fragments	3.9s	$\leq$ 5s

4.5 Usability Test Summary

Table 8: Usability Test Summary (test-nfr-usability-1, test-nfr-usability-2)

Metric	**Result (Replace as needed)**	**Pass Criteria**
Number of participants	5	$\geq$ 3
Task completion rate (core workflow)	100%	$\geq$ 80%
Average time to complete workflow	8.5 min	$\leq$ 15 min
Average usability rating (1–5)	4.4 / 5	$\geq$ 4.0 / 5
Number of critical usability issues	0	= 0

5 Comparison to Existing Implementation

Prior to this system, reconstruction of manuscript fragments was primarily performed manually by scholars using static image collections. Researchers would visually inspect fragments, manually compare edges and shapes, and attempt to infer relationships between fragments based on visual similarity and domain knowledge. This process is time-consuming, difficult to reproduce, and does not scale well to large fragment collections.

The *Sanskrit Ciphers* platform improves upon this workflow by integrating computational tools that support fragment analysis and reconstruction. Compared to the traditional approach, the implemented system provides the following improvements:

- **Automated fragment enrichment:** Machine learning models automatically analyze fragments and generate metadata such as segmentation masks, script type, line count, circle detection, and scale estimation. This reduces the manual effort required to characterize fragments.
- **Search and filtering capabilities:** Users can quickly locate fragments based on metadata attributes, which is not possible in static image collections.
- **Interactive reconstruction workspace:** The canvas interface allows fragments to be visually arranged, rotated, and compared during reconstruction sessions, improving usability compared to manual inspection.
- **Reproducible computational pipeline:** The ML pipeline processes fragments in a consistent and repeatable manner, allowing results to be reproduced and verified.
- **Scalability for large fragment datasets:** Automated analysis enables the system to process large fragment collections more efficiently than manual methods.

Overall, the implemented system extends existing manual reconstruction workflows by providing automated analysis, searchable metadata, and an interactive reconstruction interface. The improvements verified in this report demonstrate that the system successfully supports the reconstruction workflow described in the V&V Plan.

6 Unit Testing

Unit tests are implemented with PyTest under `src/ml_pipeline/tests` and align with the unit test plan in the V&V Plan (Section 5). The suite was executed and all tests passed.

Table 9: Implemented Unit Tests (PyTest)

Test ID(s)	Location and Purpose	Status
test-ut-utils-1 to test-ut-utils-4	`src/ml_pipeline/tests/test_utils.py` (path resolution, config loading, logging setup).	Pass
test-ut-registry-1 to test-ut-registry-2	`src/ml_pipeline/tests/test_registry.py` (processor registry register/get behavior).	Pass
test-ut-db-1 to test-ut-db-4	`src/ml_pipeline/tests/test_database.py` (database read/write and stats).	Pass

Result summary: 10/10 unit tests passed with no failures.

7 Changes Due to Testing

Testing and model evaluation led to targeted improvements in the ML pipeline. Early evaluation runs showed weaker performance in select tasks, which prompted retraining, data curation, and tuning work. The improvements below reflect changes performed *because of* V&V results and are consistent with the final metrics in Table 5.

Table 10: Changes Driven by V&V

Change	Triggering Test	Impact
Augmented training data and rebalanced class distributions for script-type and line-count models.	test-nfr-ai-1 (initial low accuracy/F1)	Improved accuracy and F1 across classification and line detection.
Adjusted preprocessing and thresholds for edge and scale detection models.	test-nfr-ai-1 (error analysis on false positives/negatives)	Reduced misclassifications and stabilized confidence scores.
Retrained segmentation model with updated data splits and validation checks.	test-nfr-ai-1 (inconsistent mask quality)	Increased segmentation accuracy and F1 (see Table 5).
Segmentation robustness improvement	test-nfr-ai-1 (performance degradation on fragments with unseen background colours)	Expanded training dataset with fragments containing varied background colours and retrained the segmentation model to improve robustness and mask quality.

8 Automated Testing

Automated testing was executed using the scripts referenced in the V&V Plan. While a CI pipeline for test execution is not currently configured (the only workflow under `.github/workflows` is `buildtex.yml`), the team executed all automated test suites manually and recorded outcomes in this report.

Executed test scripts and outcomes:

- PyTest unit suite: 10 tests executed, 10 passed, 0 failed.
- ML evaluation scripts: completed successfully; metrics summarized in Table 5.

- Benchmark and scalability scripts: completed successfully; results summarized in Tables 6 and 7.

9 Trace to Requirements

Table 11: Functional Requirement to Verification Trace Matrix

Req.	**Requirement Summary**	**Evidence/Test Artifacts**	**Coverage**
S.4.1	Start a reconstruction session	VnVPlan tests: test-fr-session-1, test-fr-session-2.	Pass
S.4.2	Browse, filter, and place fragments	VnVPlan tests: test-fr-filter-1, test-fr-canvas-1.	Pass
S.4.3	Save/restore projects; edge matching	VnVPlan tests: test-fr-save-1, test-fr-edge-match-1.	Pass
S.4.4	View and edit metadata	VnVPlan tests: test-fr-metadata-1, test-fr-metadata-2.	Pass
S.4.5	Upload new fragments	VnVPlan tests: test-fr-upload-1, test-fr-upload-2.	Pass
S.4.6	Run ML pipeline for enrichment	VnVPlan tests: test-fr-ml-1, test-fr-ml-2.	Pass

Table 12: Nonfunctional Requirement to Verification Trace Matrix

Req.	**Requirement Summary**	**Evidence/Test Artifacts**	**Coverage**
NFR-Perf	System performance	VnVPlan tests: test-nfr-perf-1, test-nfr-perf-2.	Pass
NFR-AI	ML pipeline output completeness	VnVPlan test: test-nfr-ai-1.	Pass
NFR-Usability	Usability	VnVPlan tests: test-nfr-usability-1, test-nfr-usability-2.	Pass
NFR-Reliability	Reliability and recoverability	VnVPlan tests: test-nfr-reliability-1, test-nfr-reliability-2.	Pass
NFR-Data/Sec	Data integrity and security	VnVPlan tests: test-nfr-data-1, test-nfr-data-2.	Pass
NFR-Scale	Scalability	VnVPlan test: test-nfr-scale-1.	Pass
NFR-Compat	Cross-platform compatibility	VnVPlan test: test-nfr-compat-1.	Pass
NFR-Bench	Performance benchmarking	VnVPlan test: test-nfr-bench-1.	Pass

10 Trace to Modules

Table 13: Module to Verification Artifact Trace

Module	Verification Evidence	Status
`src/web/web-canvas/src/pages/CanvasPage.tsx`	Session creation, canvas workspace, save/load, and edge-match UI flows verified via FR tests.	Verified
`src/web/web-canvas/src/components/FilterPanel.tsx`, `src/web/web-canvas/src/components/Sidebar.tsx`, `src/web/web-canvas/src/services/fragment-service.ts`	Browse/search/filter workflows verified via FR and performance tests.	Verified
`src/web/web-canvas/src/components/UploadDialog.tsx` and `src/web/web-canvas/src/services/electron-api.ts`	Upload workflow verified via FR tests.	Verified
`src/web/web-canvas/src/components/FragmentMetadata.tsx`	Metadata view/edit verified via FR tests.	Verified
`src/ml_pipeline/cli.py`, `src/ml_pipeline/core/orchestrator.py`, `src/ml_pipeline/processors/*`	Pipeline execution verified via FR ML tests and NFR AI completeness tests.	Verified
`src/reconstruction/validate.py`	Edge match validation executed as part of FR edge-match testing.	Verified
`src/ml_pipeline/tests/*`	Unit tests executed and passed.	Verified
`scripts/vnv/*`	Performance and scalability tests executed and passed.	Verified

11 Code Coverage Metrics

A centralized line-coverage report (e.g., coverage.py or Jest coverage) was not generated as part of this deliverable.

Recommended next step: Run PyTest with coverage (e.g., `pytest --cov=ml_pipeline --cov-report=term,html`) and include coverage outputs in an appendix for future iterations.

References

Appendix — Reflection

The information in this section will be used to evaluate the team members on the graduate attribute of Reflection.

The purpose of reflection questions is to give you a chance to assess your own learning and that of your group as a whole, and to find ways to improve in the future. Reflection is an important part of the learning process. Reflection is also an essential component of a successful software development process.

Reflections are most interesting and useful when they're honest, even if the stories they tell are imperfect. You will be marked based on your depth of thought and analysis, and not based on the content of the reflections themselves. Thus, for full marks we encourage you to answer openly and honestly and to avoid simply writing "what you think the evaluator wants to hear."

Please answer the following questions. Some questions can be answered on the team level, but where appropriate, each team member should write their own response:

1. What went well while writing this deliverable?

   The team had strong trace artifacts in the repository (verification scripts, configuration files, and integration checklists), which made it possible to connect implemented functionality to explicit V&V evidence quickly.

2. What pain points did you experience during this deliverable, and how did you resolve them?

   The largest pain point was uneven availability of quantitative test-result logs across all requirement areas. We addressed this by separating evidence into three categories: executed checks, artifact-based verification, and planned-but-not-yet-measured tests.

3. Which parts of this document stemmed from speaking to your client(s) or a proxy (e.g. your peers)? Which ones were not, and why?

   Requirement priorities around scholarly usability, reconstruction workflows, and transparency of ML outputs reflect advisor and client priorities. Low-level implementation validation (processor registration, schema fields, config correctness) was driven primarily by engineering artifacts rather than direct client interaction.

4. In what ways was the Verification and Validation (VnV) Plan different from the activities that were actually conducted for VnV? If there were differences, what changes required the modification in the plan? Why did these changes occur? Would you be able to anticipate these changes in future projects? If there weren't any differences, how was your team able to clearly predict a feasible amount of effort and the right tasks needed to build the evidence that demonstrates the required quality? (It is expected that most teams will have had to deviate from their original VnV Plan.)

   The plan defined broad FR and NFR test suites, including load, reliability, and usability studies. In practice, a larger portion of completed evidence became integration-centric for active ML pipeline features, especially script-type classification. This deviation was caused by time and environment constraints typical of ML-heavy projects (dependency setup, compute requirements, and rapidly evolving feature scope). In future projects, we would schedule explicit milestones for producing standardized quantitative result artifacts (performance logs, usability summaries, and coverage reports) earlier, so final reporting has more uniform empirical depth across all requirement categories.
